

VISTACORTEX

Product Requirements Document

Focused product scope • Finalized features • MVP planning

Document type	Product Requirements Document
Product	VistaCortex
Status	Finalized scope for MVP planning

This PRD defines the connected patient workflow across reports, reminders, care support, family assistance, and supported test booking.

Contents

Use the headings in the navigation pane to move through the document. The section structure below reflects the approved product scope.

- 1. Product Overview**
- 2. Target Users**
- 3. Core Product Features**
- 4. End-to-End User Flow**
- 5. Functional Requirements**
- 6. AI Requirements**

- 11. Business Model**
- 12. Key Product Differentiator**
- 13. Out of Scope / Safety Guardrails**
- 14. Open Decisions Before Development**

1. Product Overview

VistaCortex is a personal healthcare management platform designed to help patients organize medical test reports, understand report information, manage medicines, remember future tests, follow appropriate recovery and lifestyle plans, connect trusted family members, and book supported tests.

VistaCortex is a healthcare support tool. It is not intended to replace doctors or independently diagnose conditions, prescribe treatment, change medication doses, or make high-risk medical decisions.

Clinical safety boundary: VistaCortex must not independently diagnose, prescribe treatment, change a prescribed dose, stop a medicine, recommend a substitute medicine, or claim unsupported medical recovery outcomes.

2. Target Users

- Patients who receive medical tests and reports.
- Patients taking medicines or recovering after surgery/procedures.
- Patients who need reminders for tests and follow-ups.
- Patients who need support with appropriate diet and diet routines.
- Trusted family members or caregivers who are explicitly authorized by the patient.

3. Core Product Features

The following are the finalized VistaCortex product features. No unrelated features are included in this PRD.

3.1 Medical Test Report Storage

Purpose: Store medical test reports securely and keep them organized.

- Upload medical test reports as supported documents or images.
- Store report date, test type, provider and available metadata.
- View the original report whenever needed.
- Organize reports so they can be retrieved and compared later.
- Protect sensitive health information with appropriate security controls.

3.2 Medical Report Analysis

Purpose: Help users understand medical test reports in simple language and track measurable information over time.

- Explain what supported tests measure and why the result may be relevant.
- Extract values when the report is reliably readable.
- Compare compatible values across different report dates.
- Show increased, decreased or stable trends only when supported by the underlying data.
- Flag missing values or incompatible units instead of silently comparing them.
- Generate questions that users can discuss with a doctor.
- Keep the original report visible alongside AI-assisted explanations.

3.3 Next Test & Follow-up Reminder

Purpose: Help patients remember confirmed future tests and healthcare follow-ups.

- Allow users to enter or confirm the next test date.

- Send reminders before the scheduled test.
- Show upcoming and overdue tests.
- Create follow-up reminders after tests or care events.
- Allow selected reminders to be shared with an authorized family member.

3.4 Medicine / Tablet Reminder

Purpose: Help patients follow a confirmed medication schedule.

- Add medicine name, dose, frequency and duration from a confirmed prescription or user input.
- Create morning, afternoon, night or custom schedules.
- Send timely medication reminders.
- Allow the user to record Taken or Skipped status.
- Maintain a simple medication history.
- Provide refill reminders when sufficient information is available.

3.5 Medication Refill Alert

Purpose: Help users avoid running out of prescribed medicines by estimating when a refill may be needed.

- Allow the user to enter or confirm the current quantity of medicine available.
- Estimate the expected refill date using the confirmed medication schedule and available quantity.
- Send a reminder before the expected run-out date.
- Show Low Supply and Refill Needed alerts.
- Allow the user to mark a refill as completed and update the available quantity.
- Allow future connection to participating pharmacies if verified integration is available.

3.6 Surgery Care & Recovery Plan

Purpose: Support patients after surgery through structured, clinician-provided or appropriately validated care plans.

- Display a confirmed recovery plan where available.
- Remind users about medicines, follow-ups and recovery activities.
- Provide appropriately validated diet and recovery instructions.
- Allow users to record completion/progress.
- Clearly distinguish general guidance from individualized medical instructions.
- Direct concerning or high-risk situations to qualified healthcare professionals.

3.7 Diet Plan

Purpose: Provide supportive diet guidance based on the user's available information and relevant goals.

- Provide general diet guidance where appropriate.
- Support condition- or recovery-related diet guidance only when appropriately validated.
- Present meal and routine guidance in a simple, practical format.
- Clearly communicate limitations and encourage professional guidance where needed.
- Use validated rules for higher-risk or post-surgery users.

3.9 Test Booking

Purpose: Help users discover and book supported medical tests through participating diagnostic providers.

- Search for supported tests.
- Show participating diagnostic providers.
- Display provider-supplied availability and booking information.
- Support date/time selection where available.
- Link confirmed bookings to the test-reminder workflow.

3.10 Family Connect

Purpose: Allow patients to securely connect trusted family members or caregivers for support.

- Invite family members through a secure, consent-based process.
- Provide permission levels such as reminder-only, selected-information access, or broader authorized access.
- Share medicine reminders, upcoming tests, appointments and care-plan tasks only when permitted.
- Allow selected notifications when a medicine or scheduled task is not confirmed, if enabled.
- Keep family members' own health records separate.
- Allow the patient to change or revoke permissions at any time.
- Maintain an access/sharing history.

4. End-to-End User Flow

Product journey: Test → Store Report → Understand → Track → Remind → Care → Refill → Connect Family → Book Next Test

Step	User experience
1. Test	The patient receives or schedules a medical test.
2. Store	The patient uploads and stores the test report.
3. Understand	VistaCortex explains supported report information in simple language.
4. Track	Compatible measurements are compared across report dates.
5. Plan	The patient records medicines, follow-ups and care activities.
6. Remind	VistaCortex sends medicine, refill, test and follow-up reminders.
7. Care	The patient follows an appropriate recovery or diet plan.
8. Family	The patient can connect an authorized family member with selected permissions.
9. Book	The patient can book a supported upcoming test.
10. Continue	New reports extend the same health history.

5. Functional Requirements

- Secure authentication and account management.
- Medical report upload, secure storage, metadata and retrieval.
- OCR/document understanding for supported reports, with confirmation of important extracted fields.
- Structured storage of compatible test measurements.
- Reminder engine for medicines, refills, tests and follow-ups.
- Medication refill calculation based on confirmed medication schedule and user-entered supply.
- Recovery, diet plan/task management for supported workflows.
- AI-assisted report explanation and summarization.
- Test-provider discovery and booking integration.
- Family Connect invitations, permission levels, selected notifications and access revocation.
- User-controlled sharing and notification preferences.
- Reminder and access/sharing history.

6. AI Requirements

- Ground report explanations in the user's uploaded and confirmed records where possible.
- Use AI for supported document understanding, plain-language explanation, structured extraction and trend summaries.

- Keep the original report visible so users can verify the source.
- Require confirmation of important extracted fields before dependent workflows are activated.
- Clearly disclose AI limitations and uncertainty.
- Do not present AI output as an unsupported diagnosis or prescription.

7. Security, Privacy & Consent

- Encrypt sensitive data in transit and at rest.
- Use authentication, authorization and appropriate access controls.
- Use consent-driven Family Connect sharing.
- Allow patients to revoke family access.
- Share only the minimum information required by the selected permission.
- Maintain appropriate access and sharing audit logs.
- Use privacy-safe notification content.
- Define appropriate data retention and deletion controls.
- Do not silently alter original medical reports.

8. Non-Functional Requirements

Area	Requirement
Security	Sensitive data must be protected using appropriate encryption and access controls.
Privacy	Health-information sharing must be consent-based and permission-controlled.
Reliability	Scheduled reminders should remain dependable and recover from temporary failures.
Data Integrity	Original reports remain unchanged; extracted information should be reviewable.
Explainability	AI explanations should communicate source context and limitations.
Scalability	The architecture should support gradual growth in users, reports and integrations.
Usability	Core workflows should be understandable to users without technical expertise.

9. MVP Roadmap

The MVP should prove the core healthcare journey before adding broad integrations or advanced capabilities.

Phase	Scope
Phase 1 — Core	Report storage, basic health history, medicine/tablet reminders, next-test/follow-up reminders, basic report organization and plain-language analysis.
Phase 2 — Care & Support	Medication refill alerts, Family Connect, report-value comparison/trend views, surgery/recovery workflows, diet guidance.
Phase 3 — Booking	Test discovery and booking with a limited number of participating diagnostic providers.
Phase 4 — Expansion	Improved AI assistance and broader provider/pharmacy integrations after validation.

The MVP should prove the core healthcare journey before adding broad integrations or advanced capabilities.

10. Success Metrics

- Number of medical reports uploaded and revisited.
- Repeat usage of report analysis.
- Medicine reminder engagement and Taken/Skipped logging.
- Medication refill alert completion.
- Next-test and follow-up reminder completion.
- Family Connect adoption and active authorized connections.
- Care-plan engagement.
- Successful supported test bookings.
- 30/60/90-day user retention.
- User satisfaction and trust in report explanations.

11. Business Model

- Freemium patient product with premium advanced features.
- Optional family or enhanced organization subscriptions.
- B2B subscriptions for diagnostic providers, clinics or healthcare organizations.
- Test-booking/service fees only where commercially and legally appropriate.
- Provider/API integration opportunities where feasible and authorized.

12. Key Product Differentiator

VistaCortex should not be positioned as only a report-storage app, a medicine alarm, a diet planner, or a test-booking tool. Its core differentiation is the connected patient workflow: medical reports are stored and understood, compatible results are tracked, medicines and refills are remembered, care routines are organized, trusted family can support the patient, and the next test can continue the same health journey.

Final product definition: VistaCortex connects test reports, report understanding, health tracking, medicine and refill reminders, future-test reminders, recovery/diet support, family assistance, and supported test booking into one continuous healthcare journey.

13. Out of Scope / Safety Guardrails

- Independent medical diagnosis.
- Independent prescription or medication-dose changes.
- Stopping or substituting medicines.
- Replacing doctors or qualified healthcare professionals.
- Unsupported claims about recovery or health improvement.
- Unverified universal real-time pharmacy or diagnostic-provider availability.
- Automated high-risk medical decisions without appropriate clinical validation.

14. Open Decisions Before Development

- Which report types will the MVP support first?
- Which OCR/document-processing and AI approach will be used?
- Where will sensitive health data be processed and stored?
- Which diagnostic providers will be available for booking?
- Which surgery/recovery workflows will be clinically validated first?
- Which Family Connect permission levels will be available in version 1?
- Which notification channels will be supported first?
- Which privacy, security and healthcare regulatory requirements apply to the launch market?
